Ten Things

Marc P. Armstrong
Professor and CLAS Fellow
Chair, Department of Geography
Interim Director, School of Journalism and Mass Communication
Administrative Fellow (Dean-like Object), CLAS
The University of Iowa

I have three offices and the keys to prove it.
• To give a perspective on “the ten most significant discoveries in GIScience”.
• My quick reply was that I wasn’t sure there were any discoveries…
GIScience

- We do basic research, but much of what we do can be viewed as “translational” science
- In medicine the term is “from the bench to the bedside” or “from mouse to man”
- Ours might be “from map to machine”
  - Overlay (light tables)
I’ll Use Two Categories

- Perhaps the single biggest thing that we have discovered is “GIScience” itself… but that’s kind of nebulous, so I’ll turn to abstract categories to make things concrete

1. Abstraction/Theory
Abstraction/Theory

- **Transformational “view”**
  - (Waldo Tobler, map “algebra”)

- **Topological concepts**
  - (initially enabled topological data model, error checking, but then Max et al. relations)

- **Hierarchical data structures**
  - (interleaved binary addresses!)

- **Ontologies**
Operations

- Geocoding
  - (from text to coordinates: basis for mashups and Web 2.17, aside from affine, the most common transform?)

- Overlay and other map layer manipulations
  - (band sweep, etc., but basic ops have not evolved)

Local Spatial Analysis / Statistics
If you’re counting, I only fired nine bullets

- NCGIA supported work in 1990s that, with hindsight, was related to cyberinfrastructure (NSF term, not mine) and e-science (CSDM, etc.)
- Despite subsequent good work at UCSB and elsewhere, need stronger engagement with distributed collaboration, simulation and data intensive computing
The End
